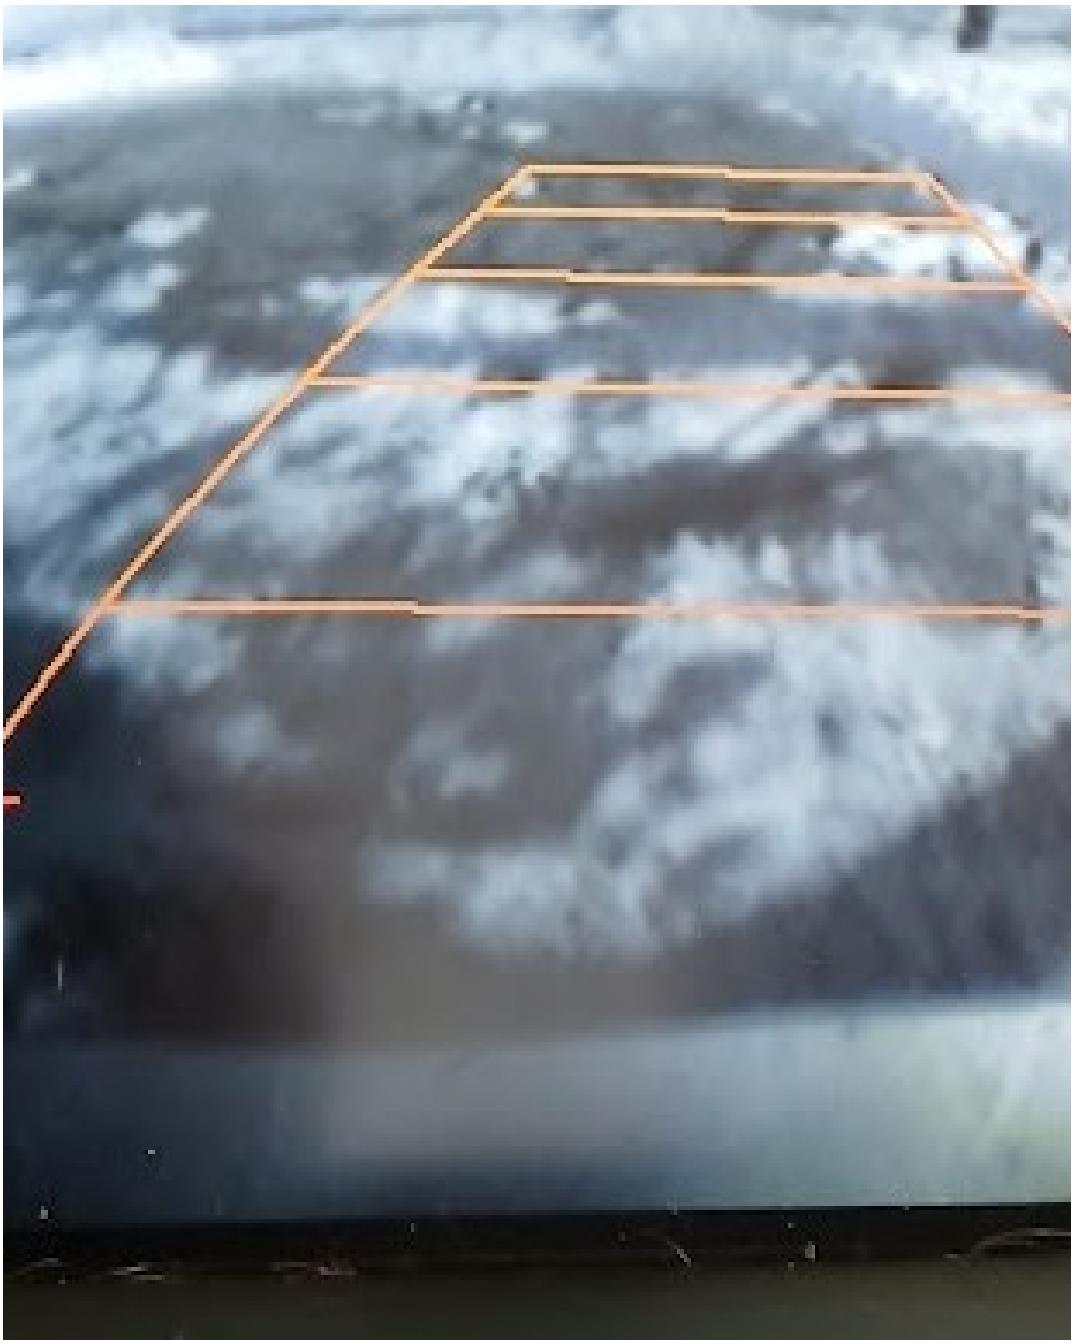
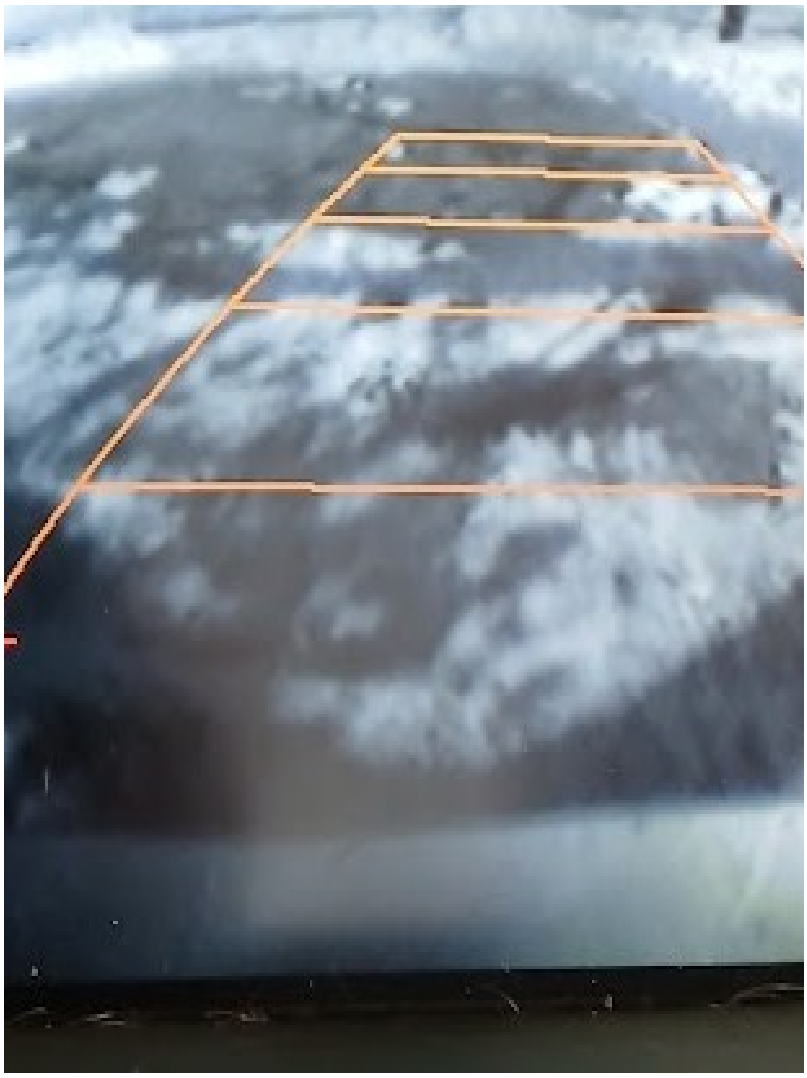
Hidden in Plain Sight





*A wolf-like form appears within reflected light and surface texture.*

Entry 200 in the ongoing Menagerie.

This image emerged through a reverse camera capture,
revealing a reflected surface layered with light and irregular pattern.

Within that shifting field,
a wolf-like face becomes perceptible—
elongated, angled, and slightly turned.

Unlike more immediate or stable forms,
this figure appears in transition,
as though forming and dissolving at once.

The image was first noticed through the device,
then held long enough to be recognized.

As with all entries in this series,
it is presented without conclusion—
an open space between perception and meaning.

# What do you see?
